

Rollout Plan

12-month go-to-market plan, field guides and content calendar

A practical strategy to acquire, activate, retain and grow a base of Nigerian SMEs, then build a trusted path from business records to financial readiness and growth opportunities.

STRATEGIC SEQUENCE

Understand the business → prove value → build habits → generate trusted data → improve financial readiness → connect to growth opportunities

What this document contains

- The 12-month rollout: positioning, eight phases, channels, team, pricing experiments, targets and weekly measures.
- Field guides: the discovery interview questions, a demo script and the pilot feedback questions.
- A weekly content calendar for WhatsApp, Instagram and TikTok.
- How each rollout phase lines up with BizLedger's product releases.

1. Executive Summary

BizLedger should launch as a practical business tool first, not as a complicated finance or AI platform. The initial promise is simple: help an SME understand sales, expenses, stock, debts and profit. Once owners use the product consistently, BizLedger can turn that operating history into useful business intelligence, a clearer picture of financial health and, eventually, a permissioned profile that can support financing and growth opportunities.

The rollout is deliberately staged. It begins with direct conversations and a small assisted pilot, then expands through referrals and business communities. Advanced features and financing partnerships come only after the core product shows repeated use and produces reliable data.

North-star principle: do not ask business owners to keep records for the sake of record-keeping. Show them how records help them make better decisions today; let financial readiness become the next benefit.

12-month outcomes to work toward

Outcome	What it means
30 owner interviews	Completed in the first week, before any pilot recruitment.
5,000 registered businesses	An illustrative registration target by month 12 to help plan effort, not a forecast.
D30 retention	The core retention measure, improved cohort by cohort.
Trustworthy data	Permission-based, explainable use of every business's information.

Registration targets are planning assumptions, not forecasts or guarantees. Activation, repeat use, retention, user outcomes and trust matter more than headline downloads.

2. Positioning and Initial Customer

Start with one or two business segments so the team can learn quickly, tailor onboarding and build a credible word-of-mouth loop. Do not try to serve every kind of SME with the same message on day one.

Initial hypothesis: phone-accessory and small-electronics retailers. Validate it through interviews before committing. These businesses tend to have frequent sales, stock movement, supplier purchases and customer credit, all workflows BizLedger already handles. Alternative test segments: fashion retailers, mini-marts, cosmetics sellers, food businesses and small wholesalers.

Initial value proposition

“Know what you sell, what you spend, what you owe, what customers owe you, which products move, and whether your business is actually making money.”

The longer-term promise is to help SMEs turn consistent business activity into credible, user-controlled evidence of performance that can support financial readiness and relevant growth opportunities.

Messaging ladder

Stage	Message	Proof the product must deliver
First contact	Know where your money goes.	Easy sales and expense recording.
Early habit	Know your real business position.	Useful profit, stock, debtor and cash summaries.
Ongoing use	Make better business decisions.	Relevant alerts, trends and recommendations.
Future value	Show the strength of your business.	A reliable business profile and explainable readiness indicators.

3. Rollout Phases and Timeline

The phases overlap slightly. Move forward when the evidence supports it, not simply because a date has arrived.

Phase	Timing	Main objective	Exit evidence
1. Discovery	Week 1	Understand the real workflow and pain points.	30 interviews; patterns and objections documented.
2. Pilot recruitment	Week 2	Recruit a small group willing to use the app.	10–15 pilot businesses recruited and scheduled.
3. Assisted pilot	Weeks 3–6	Improve activation and repeated use.	Onboarding and retention data reviewed weekly.
4. Controlled launch	Months 2–3	Reach the first 100–200 registrations through focused channels.	Clear acquisition sources and evidence of repeat use.
5. Referral engine	Months 3–5	Turn satisfied users into a repeatable acquisition channel.	Referrals lead to activated businesses, not just sign-ups.
6. Intelligence features	Months 4–6	Test BizHealth, AI insights and readiness tools with small cohorts.	Users understand and act on insights; data quality is adequate.
7. Financing partnerships	Months 6–9	Test introductions or matching with suitable providers.	Partner terms, consent flow and outcome tracking work.
8. Segment or city expansion	Months 9–12	Expand after retention and support are repeatable.	A playbook that can be repeated in a new cluster.

4. Product Readiness by Phase

What the app can do at each point in the rollout, using BizLedger's product roadmap. The rollout clock starts when discovery begins; the product timeline below assumes discovery starts in October 2026.

Rollout phase	What the app supports	Gap and what to do
Discovery and pilot (weeks 1–6)	Release 1.1, live today: sales with cash, transfer, POS and credit; stock and low-stock alerts; expenses; customers and debt repayments; profit, cash and analytics; staff and branches; WhatsApp receipts and reminders.	Ship 1.2 (password reset, secure sign-in storage, privacy notice) before onboarding pilot businesses. Supplier debts are not in the app yet: note in feedback what owners record outside BizLedger.
Controlled launch (months 2–3)	Release 1.3: suppliers, purchase orders, goods receipts, supplier debt, refunds, PDF receipts and exports.	Completes the "what you owe" part of the value proposition.
Referral engine (months 3–5)	Release 1.3; referral codes and tracked invitation links still need building.	Build referral tracking before this phase starts.
Intelligence features (months 4–6)	Releases 1.4–1.6: stockout alerts with supplier ranking, operating-model presets and scenario planning.	BizHealth and the AI copilot are planned for later releases (2.0–2.1). Test them as prototypes with small cohorts, or move this phase later.
Financing partnerships (months 6–9)	Release 1.7: offline capture, data-protection review by counsel, monitoring.	BizScore, BizPassport and consented data sharing are planned for releases 2.2–3.0. Limit this phase to partner interviews and referrals until they exist.
Expansion (months 9–12)	Releases 2.0 onward.	Expand only once retention, support and the privacy process are reliable.

5. Phase 1: Discovery (Week 1)

Goal: establish whether BizLedger solves a frequent, costly problem for a specific type of business. Do not open interviews with a long feature list.

Actions

- Interview 30 business owners in one or two target clusters. Visit in person where possible and watch how sales, stock and debts are tracked today.
- Ask owners to describe the last time they could not explain their profit, ran out of a fast-moving product, forgot a customer debt or lacked records for a business decision.
- Ask what they currently use: notebook, calculator, spreadsheet, POS reports, bank alerts, WhatsApp messages or memory.
- Show a short demo only after listening, and ask the owner to complete a realistic task, such as recording a sale or checking a customer's balance.
- Record objections: time required, fear of data exposure, language, phone limitations, internet reliability, staff use, perceived cost and trust.

Interview guide

Ask these in order, and listen more than you talk. Write down the owner's own words.

1. How do you record your daily sales?
2. How do you track expenses?
3. How do you know your actual profit?
4. How do you monitor the goods remaining in stock?
5. Do customers frequently buy on credit?
6. How do you track what you owe suppliers?
7. Have you ever struggled to obtain a business loan?
8. What business-management tools have you tried?
9. What prevents you from using them consistently?

Demo script

Only after the interview. Use one of the owner's own everyday transactions, not sample data.

"BizLedger helps you track your sales, expenses, stock and customer debts so you can understand how your business is performing. Let me show you how it works using one of your everyday transactions."

Then record that transaction together, show where it appears (sales list, stock level, profit and, for a credit sale, the customer's balance) and hand the phone over so the owner records the next one.

Deliverables

- A one-page summary of the three most frequent problems.
- A ranked list of the most valuable first-week workflows.
- A list of reasons people might refuse or stop using BizLedger.
- A short product demo tailored to the chosen segment, and a simple pilot invitation.

6. Phase 2: Recruit and Run a Pilot (Weeks 2–6)

Recruit 10–15 businesses for a hands-on pilot. The objective is learning and sustained use, not publicity.

Recruit owners who represent the chosen segment and will give honest feedback, not only friends who want to be supportive.

Assisted onboarding checklist

- Create the business profile and set the business type and opening details where supported.
- Add a small selection of products; do not make owners enter their whole catalogue before they experience value.
- Record the first sale or expense together, and confirm the owner can repeat it alone.
- Show how to review sales, expenses, stock, customer debts and profit as the current app supports them.
- Explain what information is stored, who can see it, how it is protected, and what will never be shared without permission.
- Schedule check-ins after 2–3 days and again after one week; ask about specific friction points rather than general opinions.

Pilot feedback guide

Use these at each check-in. Specific answers are more useful than "it's good".

1. What have you used most?
2. What was confusing?
3. What did you have to record outside BizLedger?
4. What would make you use it every day?

After 14 days, ask every pilot owner whether they intend to keep using BizLedger, and why. Record the answer and the reason word for word; a "no" with a clear reason is as valuable as a "yes".

Illustrative pilot targets

Measure	Initial target	Interpretation
Businesses recruited	10–15	Enough for close observation, not statistical proof.
Complete onboarding	At least 12 if 15 are recruited	Shows the setup process is manageable.
Active on 3+ days in week 1	At least 9	An early signal of habit formation.
Still active in week 4	At least 6	An early retention signal; investigate every dropout.
Intend to continue at day 14	Record every answer	The clearest early signal of perceived value.
Willing to recommend	At least 5	A qualitative signal of perceived value.

Treat these as working targets, not industry benchmarks. If they are missed, fix the workflow before buying ads or adding features.

7. Phase 3: Controlled Launch (Months 2–3)

Expand to roughly 100–200 registrations through a few measurable channels. Keep the audience and the message focused.

Channel	Execution	What to measure
Direct market visits	Visit shops during quieter periods; give a 3–5 minute demo; offer assisted setup.	Conversations, demos, activations and 30-day retained users.
Associations and cooperatives	Ask leaders to arrange a short practical session; demonstrate a relevant use case.	Attendance, opt-ins, activated members and follow-up use.
WhatsApp Business	Opt-in follow-up lists or groups; short tips, product updates and support (see the content calendar in section 8).	Replies, demo bookings, support resolution and activation.
Instagram and TikTok	Short examples: recording a sale, settling a customer debt, spotting a fast-moving product.	Qualified enquiries, demo requests and sign-ups that activate.
Founder network	Invite relevant business owners and ask for direct feedback, not vanity downloads.	Activation and retention by referral source.

Funnel: contact → demo → sign-up → first useful action → repeat use → retained user → referral.
Keep a spreadsheet or CRM with source, date, status, next action and reason lost. Never report registrations alone as traction.

8. Weekly Content Calendar

One short, practical post a day for WhatsApp Business (status and opt-in groups), Instagram and TikTok. Each post teaches something useful on its own and shows BizLedger only where it genuinely helps.

Day	Content	How BizLedger fits in
Monday	How to calculate your business's actual profit	Revenue minus cost of goods and expenses, as the dashboard shows it.
Tuesday	How to track customers who owe you money	Credit sales, customer balances and WhatsApp reminders.
Wednesday	How to avoid running out of fast-selling products	Low-stock alerts and best-seller lists.
Thursday	How to separate business and personal expenses	Recording business expenses by category.
Friday	How to review your weekly performance	The 7-day chart, top products and activity feed.
Saturday	Short BizLedger demonstration	One everyday task recorded start to finish in under a minute.
Sunday	Business tip or user success story	Share stories and figures only with the business owner's explicit permission.

Measure replies, demo requests and sign-ups that activate for each post type, and drop the formats that do not lead to activated businesses.

9. Phase 4: Build a Referral Engine (Months 3–5)

Referrals should come from demonstrated value. Ask users to refer another business only after they have completed a meaningful task and can explain the benefit themselves.

- Create a simple referral code or tracked invitation link for each user.
- Reward a referral only when the new business completes onboarding and a meaningful usage milestone, under a clear anti-abuse policy.
- Test non-cash rewards first: assisted setup, a premium feature trial, a monthly business report or priority support.
- Recruit a small number of trusted business-community ambassadors, paid for qualified activations rather than raw leads.
- Collect testimonials only with informed permission. Never expose sales figures, names or business information without explicit consent.

10. Phase 5: Product-Led Retention and Intelligence (Months 4–6)

Retention depends on BizLedger becoming part of the owner's normal routine. Make the everyday workflow fast before expanding into complex AI or financing features.

Daily, weekly and monthly loop

Frequency	User action	Value returned
Daily	Record sales, expenses and stock changes.	A current view of business activity and money movement.
Weekly	Read the weekly business summary.	A practical decision about restocking, collections or spending.
Monthly	Read the monthly performance report.	A clear view of performance, trends and issues to address.
When needed	Export or share a report under the owner's control.	Evidence for a supplier, adviser or potential financing partner.

The goal is to make BizLedger useful for decisions, not just record-keeping. Each summary should end in something the owner can act on that week or month.

Weekly usage loop: the weekly business summary

Every week, BizLedger generates a business summary for the owner covering:

- Total sales.
- Total expenses.
- Estimated profit.
- Outstanding customer debts.
- Supplier obligations (once suppliers and purchases arrive in release 1.3).
- Fast-moving products.
- Products that may need restocking.

Monthly usage loop: the monthly performance report

Every month, BizLedger generates a performance report that helps the owner understand:

- Whether revenue increased or decreased.
- Which expenses changed.
- Whether margins improved.
- How much money customers still owe.
- Whether working capital is sufficient.

Reduce data-entry friction

Explore features such as:

- Quick transaction entry: minimise taps for common entries, with sensible defaults and reusable categories.
- Product templates for common business types, plus sample data for demonstrations.
- CSV imports (and exports) where practical.
- Receipt capture.

- Voice-based entry.
- WhatsApp integration.
- Automated transaction imports, where available and authorised by the business.

Build receipt capture, voice entry, WhatsApp integration and automated imports only once research confirms demand. Alongside these:

- Test weak connectivity and recovery from interrupted sessions.
- Offer responsive human support during early onboarding, and make feedback easy to submit.

Feature sequencing

Priority	Feature direction	Release condition
1	Reliable sales, expense, stock, debtor and creditor workflows	Core calculations and access controls tested.
2	Business metrics and useful reports	Data definitions are consistent and users can verify totals.
3	AI business copilot and insights	Grounded in actual business data; flags uncertainty.
4	BizHealth indicator	Factors are explainable; users can correct the underlying records.
5	BizScore / financial-readiness indicator	Clearly labelled as an internal readiness estimate, not an official credit score.
6	BizPassport and permissioned sharing	Purpose, scope, expiry, revocation and audit trail implemented.
7	Financing marketplace and matching	Providers vetted; legal, privacy and disclosure reviews complete.

11. Phase 6: Financing and Growth Partnerships (Months 6–9)

BizLedger should first act as a readiness and matching layer, not a lender. Build relationships with appropriately licensed banks, microfinance banks, fintech lenders, development-finance programmes, cooperatives and business-support organisations. Validate each provider, and make clear that eligibility and approval remain the provider's decision.

Suggested sequence

- Interview potential financing partners about evidence requirements, target sectors, ticket sizes, eligibility rules and application process.
- Create a transparent financing-readiness checklist that explains the gaps an SME can work on before applying.
- Begin with partner information and referrals; do not promise approval, rates or disbursement unless the provider confirms them.
- Add an application or matching flow only after the consent and data-sharing process is clear and tested.
- Measure application starts, completed applications, offers, approvals, disbursements, rejection reasons where available, and complaints.
- Explore supplier credit, equipment financing, working capital, insurance or growth programmes only where there is real demand and a credible partner.

Minimum safeguards before any partner data sharing

- Specific, informed permission from the business for the stated purpose and data fields.
- A way to review, withdraw and revoke access where applicable, with an audit trail.
- Data minimisation: share only what the chosen purpose needs.
- A clear explanation of scoring factors, data-quality limits and the difference between readiness estimates and lender decisions.
- Legal and compliance review of Nigerian data-protection, consumer-protection and financial-services requirements before launch.

12. Phase 7: Expand Only After Repeatability (Months 9–12)

Expansion should follow evidence of retention, customer outcomes and manageable support costs. Add one new business cluster or segment at a time.

- Choose the next cluster by interview demand, referral requests, acquisition cost and similarity to the proven workflow.
- Adapt onboarding and examples to the segment while keeping the core data model the same.
- Train one or two local ambassadors and document the field-sales process.
- Compare activation, retention, support burden and referral rates between the original and the new segment.
- Expand geographically only when onboarding, support, privacy and incident response are reliable.

13. Acquisition Channels and Operating Team

Recommended channel order

Order	Channel	Reason
1	Founder-led direct outreach	Fast learning and direct access to objections.
2	Referrals from active users	Builds trust and reduces acquisition effort.
3	Associations, cooperatives and market groups	Reaches relevant owners in groups.
4	WhatsApp and practical educational content	Supports follow-up and continued engagement.
5	Business-support and financing partners	Adds credibility and future distribution.
6	Paid digital ads	Only after activation and retention are understood.

Lean team and responsibilities

Role	Core responsibility
Founder / product lead	Customer discovery, product priorities, partnerships, weekly metrics and trust.
Developer / technical lead	Reliability, onboarding, analytics, security, fixes and feature delivery.
Business development / field lead	Market visits, demos, associations, pilot follow-up and referral recruitment.
Customer success	Onboarding, support, user education, churn interviews and feedback synthesis.
Content and growth support	Short demonstrations, the weekly content calendar, lead tracking and channel experiments.

In the earliest phase one person may cover several roles. Give every responsibility a named owner even if the team is small.

14. Pricing Experiments

Do not charge before the product consistently delivers a result users value. Test willingness to pay through interviews and small experiments rather than assuming a price from competitor listings.

Tier	Possible contents	Purpose
Free / Starter	Core records, limited summaries and basic exports, within sustainable usage limits.	Reduce adoption friction and build a usage habit.
Pro	Advanced reports, deeper insights, additional users or locations, premium support and richer exports.	Test whether recurring value supports a subscription.
Partner-supported	Sponsored access, training or referrals through an organisation.	Reach groups where a trusted partner can support distribution.

The working price-test range for Pro is ~~N~~3,000–~~N~~10,000 a month, a range to test, not a final price. The plans proposed in the blueprint addendum (Growth at ~~N~~3,500 and Business at ~~N~~9,500 a month) sit inside it and can be used as the two test points. Validate affordability, willingness to pay, support cost and perceived value with real users, and keep any financing-referral compensation transparent.

15. Illustrative Registration Targets

An ambitious planning curve to help allocate effort. It is not a forecast, a promise or evidence of likely adoption. Adjust it monthly using actual acquisition and retention data.

Month	Cumulative registrations	Primary focus
1	15	Discovery and pilot.
2	50	Controlled launch.
3	150	Focused acquisition channels.
4	300	Referral experiments.
5	500	Retention and selected feature tests.
6	750	Repeatable onboarding and insights.
7	1,000	Partner exploration and activation.
8	1,500	Improve conversion and referrals.
9	2,000	Early financing-match experiments, if ready.
10	2,500	A new cluster only if retention supports it.
11	3,000	Strengthen repeatability.
12	5,000	Expand proven channels; audit the quality of growth.

16. What to Review Every Week

Metric	Definition / question	Why it matters
Acquisition source	Where did each lead and sign-up come from?	Shows which channels bring relevant users.
Activation rate	What share complete onboarding and a first useful action?	Measures whether sign-ups reach value.
Time to first value	How long from sign-up to a meaningful result?	Highlights setup and usability friction.
D7 / D30 retention	What share return after 7 and 30 days?	Tests whether the app stays useful.
WAU / MAU	How many businesses are active weekly and monthly?	Tracks usage breadth and frequency.
Record consistency	Are records entered often enough for useful summaries?	Indicates data quality and habit strength.
Referral activation	Do invited businesses become active, retained users?	Separates useful referrals from vanity growth.
Free-to-paid conversion / MRR	How many pay, and what recurring revenue results?	Tests whether the business model works.
CAC and support cost	What does it cost to acquire and support an activated business?	Supports sustainable growth decisions.
Financing outcomes	Applications, offers, approvals, disbursements and complaints.	Measures real value, not just matches.

Review the numbers by cohort and channel. A smaller group of active, satisfied businesses can be worth more than thousands of registrations that never use the product again.

17. Trust, Privacy, Security and Responsible Claims

BizLedger's long-term value depends on SMEs trusting it with sensitive commercial information. Trust has to be designed into the product and the field-sales process from the start.

- Use secure authentication, role-appropriate permissions and business-level data isolation, and test the access controls, not just the interface.
- Protect secrets and API keys, maintain backups and have a process for responding to security incidents.
- Explain what data is collected and why. Provide clear privacy notices and consent flows for optional integrations and sharing.
- Never expose one business's information to another business, to a staff member without permission, or to a partner without an appropriate basis and the owner's authorisation.
- Make AI-generated insights traceable to the underlying data where possible, and label estimates, incomplete records and uncertainty.
- Do not claim BizLedger guarantees loans, is an official credit bureau or provides a regulated credit score unless that status is real.
- Review Nigerian data-protection, consumer-protection, lending, payments and other financial-services requirements with qualified advisers before regulated or partner-dependent features go live.

18. First 30 Days: Action Plan

Week	Actions	Deliverable by the end of the week
Week 1	Interview 30 owners with the interview guide; observe current record-keeping; test the core promise with the demo script; document objections.	Discovery findings, the chosen initial segment and ranked pain points.
Week 2	Recruit 10–15 pilot businesses; prepare onboarding; confirm the privacy explanation and the feedback process; start the content calendar.	Pilot roster, onboarding checklist and baseline metrics.
Week 3	Onboard owners in person or by video; observe real tasks; run the first feedback check-ins; fix the most frequent friction.	First-transaction completion and an issue log.
Week 4	Check repeat use; interview inactive users; run the 14-day continuation question; collect testimonials only with permission.	Pilot review, retention results and prioritised product changes.

Daily founder routine during the first month

- Speak to a few target users or pilot businesses every day.
- Review sign-ups, first useful actions, active businesses and unresolved support issues.
- Fix the highest-impact blocker before adding lower-priority features.
- Record why people refuse, delay onboarding or stop using the app.
- End each week with a decision: continue, change the message, simplify onboarding or narrow the segment.

19. The Three Distribution Engines

Engine	How it works	When to prioritise
Direct distribution	The founder and field team visit businesses, demo the product and help them start.	Immediately; best for learning and early trust.
Community distribution	Associations, cooperatives, market leaders and ambassadors introduce BizLedger to groups.	Once onboarding is repeatable and group demonstrations work.
Financial distribution	Providers and business-support organisations refer SMEs or use consented BizLedger information in their workflow.	After product data, privacy controls and partnership terms are ready.

20. Final Recommendation

Build growth around a clear progression:

1. Help a business understand its daily operations.
2. Give it a reason to return each week.
3. Turn reliable records into useful financial intelligence.
4. Help the owner understand strengths and gaps.
5. Let the owner choose whether to share a business profile.
6. Connect the business to suitable financing or growth opportunities through credible partners.

The most important early milestone is not 5,000 registrations. It is proving that a defined group of business owners repeatedly use BizLedger, trust it with their records, and can point to a practical improvement it has helped them make. Once that is true, scale acquisition; once data and consent are dependable, scale financial-readiness and partner features.

Document note: this plan is a practical operating framework. Targets, prices and timing are hypotheses to validate through user research and actual cohort performance, and should be revised as evidence accumulates.
